

## Water Conservation Policy

SVCE recognizes the importance of water conservation and is committed to sustainable water management practices to preserve this vital resource for future generations.

### Objectives

1. Reduce water consumption.
2. Promote efficient use of water resources.
3. Implement rainwater harvesting and other water conservation techniques.
4. Raise awareness about the importance of water conservation.

### Measures to be taken to conserve water on campus

#### Water Use Reduction

Install water-saving fixtures, such as low-flow taps and showerheads, in all campus buildings. Encourage the use of dual-flush toilets to minimize water wastage. Regular inspections will be conducted to identify and repair any leaks in the plumbing system. A reporting system will be established for students and staff to report leaks and other water-related issues promptly.

#### Rainwater Harvesting

Rainwater harvesting systems will be installed to capture and store rainwater for non-potable uses, such as irrigation and toilet flushing. Stored rainwater will be regularly tested to ensure its quality for intended uses. Use drought-resistant and native plants in landscaping to reduce the need for irrigation. Implement drip irrigation systems to minimize water wastage in gardens and green spaces.

#### Awareness, Monitoring and Evaluation

Conduct workshops and seminars to educate the campus community about water conservation techniques and the importance of saving water. Display informational posters and signage around the campus to remind everyone to use water responsibly. A Water Conservation Committee will be formed to monitor water usage and evaluate the effectiveness of conservation measures. Water meters will be installed in key areas to track consumption and identify opportunities for further reduction. Review and update the policy regularly to incorporate new technologies and best practices in water conservation.

SVCE is dedicated to sustainable water management and conservation. By implementing effective water-saving measures and promoting responsible water use, the institution aims to preserve this precious resource for future generations.
